

BEAUTY LIGHT COLLAGEN LAMPS

ANTI-AGING WITH A SYSTEM

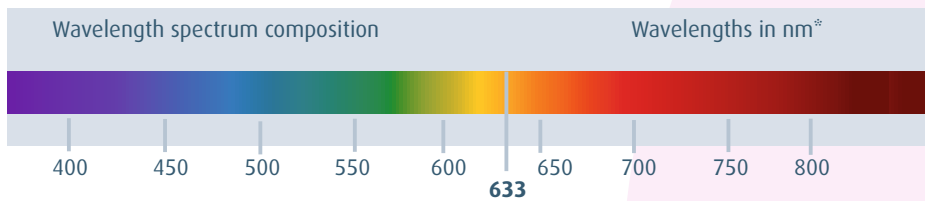

The Beauty Light lamp series is the centrepiece of an innovative Ergoline concept towards combating the effects of skin aging. These anti-aging lamps were specifically designed for Ergoline collagen units. Beauty Light collagen lamps use visible red light to act on the skin's own photobiostimulation processes, stimulating collagen and elastin production for a substantial reduction in wrinkles to give you visibly tauter skin and a healthier complexion.

Beauty Light by Ergoline is the latest generation in anti-aging treatment.

Ergoline

ANTI-AGING WITH A SYSTEM

Beauty Line Collagen gives you an innovative anti-aging and wellness concept – improving your skin’s appearance and complexion, reducing moles and wrinkles, and giving you a healthy, glowing complexion. Ergoline collagen treatment stimulates the circulation, while increasing collagen and elastin production to give you visibly tautened, rejuvenated skin. Collagen treatment increases your skin’s permeability to boost the effect of additional cosmetic products. As another side effect, your serotonin levels will increase during the treatment – a very relaxing effect that will also raise your general feeling of well-being. Beauty Light collagen lamps emit red light at visible wavelengths of around 580–640 nanometres.

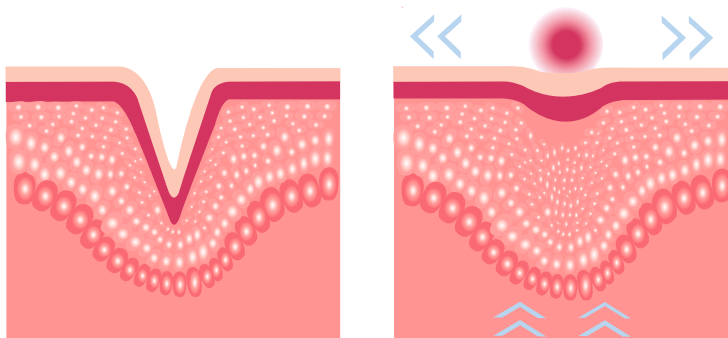

*nm = unit of measurement in the light spectrum

SKIN AGING AND WRINKLES

Several factors play a role in skin aging. Nutrient supply to the upper layer of the skin, the epidermis, starts to deteriorate as early as at twenty-four years of age, resulting in a worn-looking, pallid and uneven complexion. The fibroblast metabolism slows down with increasing age; fibroblasts are the cells that produce collagen. From then on, the collagen levels in your skin will decrease by an average of one percent each year; your skin will begin to sag, as collagen is the most important cushioning material in the connective tissue. Reduction in cell generation also leads to loss of skin moisture and elasticity, which leads to wrinkling. Collagen treatment tackles the causes of skin aging the natural way – from inside.

Ergoline Beauty Light collagen lamps emit red light at wavelengths of around 633 nm, wavelengths that are taken up by the fibroblasts to stimulate intracellular energy transfer – a process known as photobiostimulation, which boosts your metabolism, and therefore also collagen and elastin regeneration. Clinical trials have demonstrated that skin cells regenerate one and a half to two times as fast in collagen lamp treatment. Apart from cell metabolism, the treatment improves your skin’s permeability, making it more accessible to the body’s own nutrient supply, giving you a tauter, healthier complexion.

WRINKLE

REDUCING WRINKLES USING BEAUTY LIGHT

PHOTO BIO STIMULATION

Skin regeneration and rejuvenation

- CLINICALLY PROVEN COLLAGEN AND ELASTIN STIMULATION
- VISIBLE ANTI-AGING EFFECT
- COMBATS WRINKLES AND FINE LINES
- IMPROVES YOUR WHOLE COMPLEXION
- PREPARES YOUR SKIN FOR COSMETIC TREATMENT
- PROTECTS YOUR SKIN FROM DAMAGING ENVIRONMENTAL INFLUENCES

TREATMENT WITH BEAUTY LIGHT COLLAGEN LAMPS

BEAUTY LIGHT FOR ANY SALON CUSTOMER

- Collagen treatments are safe for any customer of any age.
- Improves the complexion and reduces environmental influences on the skin on your younger customers.
- Beauty Light rejuvenates the skin on your middle-aged customers, counteracting the initial signs of aging skin.
- Collagen treatment actively tackles the signs of aging on older skin, reducing wrinkles and revitalising the complexion.

Ideal treatment period:

The average treatment period should be around fifteen and twenty minutes, with a period of twenty minutes always giving you the best results.

Treatment recommendations:

Collagen treatment should be applied over a period of at least twelve weeks for best results. Additional high-quality skin-care products may improve the result even further.

Recommendation after treatment:

After treatment, your customers will easily be able to make the effect last by combining two to four sessions per month with specialised skin-care products.

* Depending on type of tanning devices as well as number of lamps.

SAFE APPLICATION

Compared to other skin-rejuvenation treatments such as laser therapy, red-light treatment will not lead to skin removal, burns or breaks; this also eliminates the risk of inflammation and erythema. The red light used is absolutely safe for use on any type of skin. The only criteria against taking collagen treatment are pregnancy, epilepsy, increased light sensitivity, or use of drugs that increase light sensitivity, such as antibiotics. Collagen treatment is harmless to the eyes, but due to the high light levels, you should wear eye protection. There are no known negative side effects, and no regeneration times to worry about in this consumer-friendly, simple treatment. Photobiostimulation can be combined with other treatments such as microdermabrasion, Botox, wrinkle-filling, peelings etc. for an even better outcome. To maximise the photobiostimulation effect, we recommend complete skin cleansing – such as peeling – as well as removing any jewellery before treatment starts. No other preparations are needed.

Treatment with high-quality skin products should follow collagen treatment if possible; collagen treatment also increases skin permeability to boost the effectiveness of cosmetic products. You will be able to achieve especially impressive results for your customers by combining treatments.
